D1: US5008986A D2: US5628094A D3: EP1057423A1 D4: EP1175842A2 D5: EP1201144A2 D6: US5444898A

INVENTION

The invention discloses a water repellent slide fastener, comprising a pair of zipper tapes, to which are secured fastening elements which are unfastenable through intermediary of a zipper slide. The zipper tapes are water repellent. An object of the invention is to provide a water repellent slide fastener which enables an easy-to-use, easysliding zipper, yet provides a reliable shield for water leakage and seepage. Another object is to provide a type of water repellent slide fastener, which does not leave a gap that lets moisture inside a garment when it is exposed to lateral tensile forces. This is obtained by first and second zipper tapes which are secured to the fastening elements asymmetrically relative to each other, such that the first one extends, in the form of an extension crossing a centre line between the tooth elements, over the second zipper tape to overlap a part of the second zipper tape. The second zipper tape has its other edge, the far edge relative to the garment, fitted with the fastening elements. The zipper tape, which has the extension, has the fastening elements secured to the point, from which the extension commences. The invention also relates to a zipper slide for use in association with the slide fastener.

In case the space in any of the preceding boxes is not sufficient. Continuation of: Box V

DISCUSSION AND CONCLUSION

Claims 1-7

D1 discloses a slide fastener for footwear or protective garments constituted of two support tapes (13), chains of teeth (11) and a slide-tab (16). One object of the invention is to obtain optimal seal, against dirt as well as snow and water. The chains of teeth (11) of the slide fastener are connected to their respective support tape (13) and mounted, brought together, such that they are located raised on the single side (13'') of said tapes adapted to be turned towards the inside of said footwear or garment. According to alternative embodiment, the chains of teeth (11) are affixed at a distance substantially less than that corresponding to the depth of nesting of the teeth or spirals (12). Thus, when the chains of teeth (11) are interlocked with one another by means of the slide (16), the borders (15) of the tapes (13) are applied with a certain pressure against one another or overlapping which, in every case, improves the imperviousness of slide fastener (1). See column 2, line 56-line 64.

The invention in claim 1 differs from the one in D1 in that the first and second zipper tapes are secured to the fastening elements asymmetrically relative to each other such that the second zipper tape has its other edge, the far edge relative to the garment, fitted with the fastening elements and in that the zipper tape, which has the extension, has the fastening elements secured to the point from which the extension commences.

The invention in claim 6 also differs from that in D1 for the same reasons as discussed above and in that the zipper slide has one of its body members formed with a recess for the extension of the zipper tape.

It is not considered obvious for a person skilled in the art to arrange the fastening elements to the zipper tapes in D1 as claimed in claim 1. Neither is it considered obvious for a person skilled in the art to arrange the zipper slide with a recess as claimed in claim 6. Accordingly, D1 does not disclose the characteristics in the characterising parts of claims 1 and 6. Consequently, there is no teaching in D1 leading a skilled person to the invention and therefore the claimed invention is not considered obvious for a person skilled in the art.

Supplemental Box

In case the space in any of the preceding boxes is not sufficient. Continuation of: $Box\ V$

Therefore, the invention according to claims 1-7 is novel, is considered to involve an inventive step and has industrial applicability.

International application No.

PCT/FI2003/000754

Box No. VIII Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:

Claim 5 states "A slide fastener as set forth in any of claims 1-6...". According to the claims, claims 1-5 relate to a slide fastener and claims 6-7 relate to a zipper slide. Therefore, claim 5 should be dependent on the slide fastener as set forth in any of claims 1-4.

According to Rule 6.4 (c), all dependent claims referring back to a single previous claim, and all dependent claims referring back to several previous claims, shall be grouped together to the extent and in the most practical way possible.

Form PCT/IPEA/409 (Box No. VIII) (January 2004)

8

Claims

- 1. A water repellent slide fastener, comprising a pair of zipper tapes (25, 26), to which are secured fastening elements (21, 22) which are unfastenable and fastenable through the intermediary of a zipper slide (30), said zipper tapes (25, 26) being water repellent, **characterized** in that the first and second zipper tapes (25, 26) are secured to the fastening elements (21, 22) asymmetrically relative to each other, such that the first one (25) extends, in the form of an extension (25X) crossing a centre line between the tooth elements, over the second zipper tape (26) to overlap a part of the second zipper tape (26), which has its other edge, the far edge relative to the garment, fitted with the fastening elements (22), and the zipper tape (25), which has the extension (25X), has the fastening elements secured to the point, from which the extension (25X) commences.
- 2. A slide fastener as set forth in claim 1, **characterized** in that the extension (25X) of one zipper tape (25) overlaps the other zipper tape (26) over the distance of 1-5 mm, commencing from the edge of the zipper tape (26) closer to the fastening elements (22).
- 3. A slide fastener as set forth in claim 1 or 2, **characterized** in that said extension (25X) substantially conceals the slide fastener's fastening elements (21, 22).
- 4. A slide fastener as set forth in claim 1, **characterized** in that the zipper tape (25, 26) has its stiffness adapted to be such that the extension (25X) of one zipper tape (25) applies at least a small weight against the other zipper tape (26).
- 5. A slide fastener as set forth in any of claims 1-6, **characterized** in that a slide fastener (13) is fitted to an article (10), e.g. a garment, a shoe, a bag,

or the like, in such a way that the zipper tape (25) has its extension (25X) positioned such that gravity denies the migration of water into possible gaps between the slide fastener's (13) fastening elements (21, 22) and/or into the slide fastener's centre slot.

- 6. A zipper slide (30) for use in association with a slide fastener as set forth in claim 1, **characterized** in that the zipper slide (30) has one (32) of its body members formed with a recess (33X) for the extension (25X) of the zipper tape (25).
- 7. A zipper slide (30) as set forth in claim 6, **characterized** in that the recess of the zipper slide (30) has a width of 1-5 mm and a depth of 0,2-0,8 mm, whereby the extension element (25X) of one zipper tape (25) presses against the other zipper tape (26).
